Card Compass

Where things stand: what's built, what's ready for launch, and what's left for you

Card Compass is a Pokémon card app. You scan or search a card, confirm the exact printing, and see its price from several sources side by side. Signed in, you can track a collection, its value over time, price alerts and a wishlist. It installs on a phone like an app today, and the iPhone and Android versions are set up for later. Interactive tour of every screen: claude.ai/artifact/J11Cda72qVegD2og91uxjA (private to you until you share it).

All built	**146 + 48**	**Demo mode**	**Not live yet**
every feature you asked for	unit and browser tests, all passing	sample data, clearly labelled	needs your accounts and keys

The short version: the app is built and tested, but it still runs on sample data. To go live it needs accounts that only you can create (free to start), a host, and a domain. Then real prices switch on with no code changes.

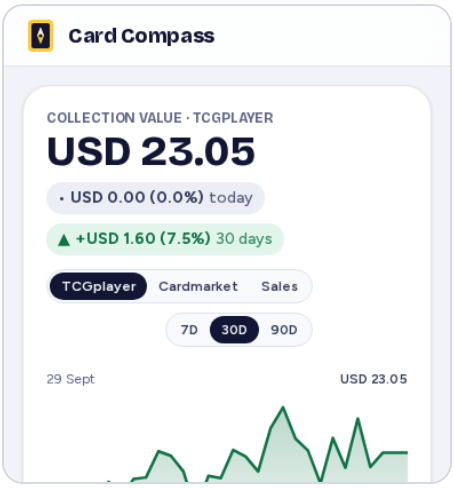

What's built

Find and price a card

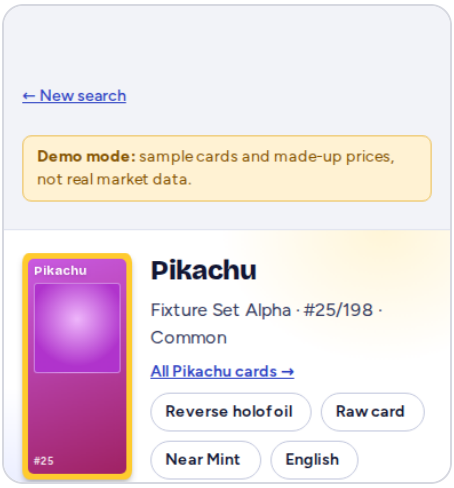

- One search bar with suggestions as you type
- **Scan** button: the camera snaps the photo by itself when the card is held still
- "Is this your card?" confirm step, or a pick-list when unsure
- Big price numbers from TCGplayer, Cardmarket and PriceCharting, each labelled with its source and date
- eBay listings ranked by the total cost delivered to your country, including shipping and import tax
- Graded cards: look up a PSA cert number, see prices for that exact grade
- Bulk scan a stack of cards at once

Collect and track

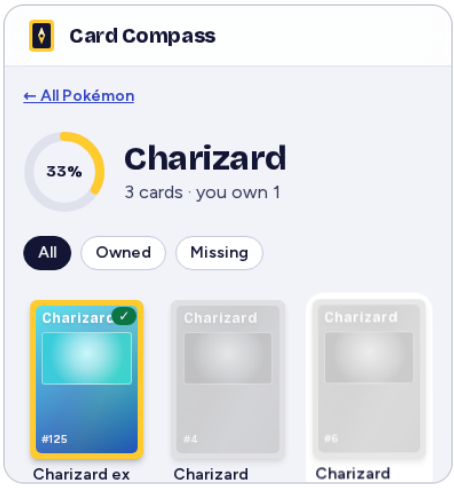

- **Portfolio home:** collection value, 7/30/90-day chart, biggest gains and drops
- Collection as card pictures, a 3×3 binder or a list
- Insight cards by set, rarity, raw or graded; tap to filter
- Set-completion rings and **Browse by Pokémon**
- Price alerts (in-app, phone push, email), wishlist, profit/loss
- CSV import/export, binders, read-only share links
- Light and dark mode, five accent colours

Portfolio home

Prices for a card

Browse by Pokémon

Launch prep already done

- **Trademark-safe naming:** "Pokédex" renamed to "Browse by Pokémon", and the app states it isn't affiliated with The Pokémon Company, Nintendo or the price sources.
- **Privacy and Terms drafts** written from what the app actually stores, linked from the footer and sign-up. They're marked "Draft" until your name and contact email are added.
- **eBay account-deletion page**, which eBay requires before it gives out real keys.
- **Hosting setup** for Vercel, which updates the database on every deploy and runs a daily job that checks price alerts.
- **Key checker:** one command (`npm run check:live`) tests every service with your real keys and lists what's missing.
- **Step-by-step guide** in `docs/DEPLOY.md`.

Nothing real has been tested yet. The connections to real data are written and tested against simulated responses, but the real services were blocked from where I worked. The first run with your keys will show whether anything needs fixing, and the key checker will point to it.

What you need to do

#	Step	Where / what	Cost
1	**Card data and prices**	Free key at pokemontcg.io. This alone swaps the sample cards for real ones.	Free
2	**Database**	Neon or Supabase account; create a Postgres database	Free plan
3	**Hosting**	Vercel account; import the repo, folder `card-compass`	Free for personal use; Pro (paid) if it's a business
4	**Domain name**	Any registrar; then connect it in Vercel	About $10–15/year
5	**Reading card photos**	Google Cloud: turn on Vision API, create a restricted key	Free tier, then per photo
6	**eBay listings**	developer.ebay.com production keys and deletion-notice setup	Free
7	**Email**	resend.com account and verify your domain	Free tier
8	**Graded/sold prices** (optional)	PriceCharting API subscription; PSA API token	PriceCharting paid; PSA free tier
9	**Expert checks**	A lawyer reviews Privacy and Terms; a customs specialist checks the EU/UK/Australia import-tax rules	Professional fees
10	**Real phone test**	Install from the live site on an iPhone and an Android phone, then scan, collect and get an alert	Free
11	**Phone apps** (later)	Apple Developer (needs a Mac) and Google Play accounts	Apple $99/year; Google $25 once

How Claude can take most of this off your plate

Run a session in the **Claude Desktop app** on your own computer, in a copy of this repo. There, Claude can use your browser and your normal internet connection, which this cloud session can't.

Claude can do

- Fill in the sign-up forms on each site
- Copy each key straight into Vercel, so keys never pass through chats or code
- Create the database, connect it, set every setting, and deploy
- Generate the passwords the app needs for its own services
- Run the key checker against real services and fix what breaks
- Register the eBay deletion page, and connect your domain
- Later, build the phone apps in Xcode or Android Studio

Only you can do

- Choose passwords and enter verification codes
- Solve "I'm not a robot" checks
- Tick "I accept the terms" on each site
- Enter payment details (domain, subscriptions, app stores)
- Approve each site the first time Claude uses it
- Hire the lawyer and customs specialist

To set it up

1. Install the Claude Desktop app.
2. Clone the repo to your computer and start a Claude Code session in that folder. Alternatively, run `claude remote-control` in a terminal there.
3. Allow browser access when asked.
4. Say: *"Set up hosting and keys from docs/DEPLOY.md."*

Decisions waiting on you

- **Give the app its own repo?** The app sits in a folder of your "Aglet-CRM" repo, whose main branch is a different project (the tribute tracker). I recommend a separate `card-compass` repo; I can make the move.
- **Business or hobby?** If it's a business, plan for Vercel Pro, and set up a company name for the Privacy and Terms pages.
- **Which data sources first?** Suggested order: Pokémon TCG API (free), then photo reading and eBay, then PriceCharting.

Not built yet

- Recently **sold** prices right after a scan: needs a sales-data source; PriceCharting covers part of it.
- Recognising a whole binder page of cards in one photo.

Code: branch `ccr-2b6a04ae-2dpts5` in myrunway27/aglet-crm, folder `card-compass`. Guides: `README.md`, `docs/DEPLOY.md`, `docs/MOBILE.md`. Summary prepared 19 October 2026.
